

EVERTRUST AI OPERATIONS ARCHITECTURE DeepSeek × Claude × n8n × ERP

Objective:

Build a scalable AI-powered tender operations engine that allows Evertrust to process 2–3x more tenders while massively reducing repetitive manual work and lowering AI infrastructure costs.

Core Principle:

AI does not replace human judgment. AI removes repetitive operational work so humans can focus on pricing decisions, customer relationships, QC, compliance, and strategic execution.

Architecture Split:

DeepSeek = Worker Layer

Claude = Supervisor + QA Layer

n8n = Workflow Engine

ERP + Postgres = Source of Truth

SYSTEM ARCHITECTURE

n8n handles workflow automation, triggers, integrations, scheduling, routing, notifications, and system communication.

ERP + Postgres stores all tender data, supplier history, customer data, pricing history, statuses, audit logs, and operational records.

DeepSeek handles high-volume operational processing such as scraping, parsing, OCR, matching, extraction, drafting, and repetitive automation tasks.

Claude handles supervision, orchestration, final reviews, QA, high-risk reasoning, compliance validation, and escalation handling.

PHASE 1 — PARTNER SCOUTING

Human-led supplier and partner acquisition lane.

DeepSeek Responsibilities:

- scrape supplier websites
- enrich CRM data
- classify supplier niches
- summarize supplier capabilities

- monitor market changes

Claude Responsibilities:

- strategic partner evaluation
- partnership risk analysis
- long-term supplier quality analysis

PHASE 2 — TENDER SEARCH & INTAKE

This is the largest automation zone and should run almost entirely on DeepSeek.

Argus (Scraper Agent):

- monitor ibau / evergabe every hour
- detect new tenders instantly
- download PDFs and attachments
- track amendments and updates
- detect deadline changes

Scribe (Parser Agent):

- parse PDFs
- parse GAEB X83
- OCR scanned documents
- extract line items
- extract locations and deadlines
- extract technical requirements
- convert documents into structured JSON

Sieve (Decision Agent):

- apply niche rules
- blacklist filtering
- location matching
- budget filtering
- bid-or-skip qualification

Claude Escalation Layer:

Claude only activates for unclear, high-risk, or legally ambiguous tenders.

PHASE 3 — SHORTLIST & CLIENT MATCHING

Goal: identify the best customer for each tender.

DeepSeek Responsibilities:

- compare tender against customer profiles

- analyze historical wins
- estimate fit probability
- generate client ranking
- draft customer outreach
- generate WhatsApp and email drafts

n8n Responsibilities:

- reminder scheduling
- response tracking
- CRM state updates
- escalation timers

Human Responsibilities:

- approve strategic outreach
- approve sensitive communication

PHASE 4 — RECORD OPEN & ASSIGN

Goal: instantly open structured ERP workflow.

DeepSeek Responsibilities:

- create ERP record
- generate tender ID
- classify tender category
- upload TYPE 1 documents
- estimate workload complexity
- auto-assign L5 PIC

Assignment Logic:

- current workload
- niche expertise
- historical performance
- deadline pressure

n8n Responsibilities:

- create folders
- sync statuses
- move files automatically

PHASE 5 — PRICING (MOST IMPORTANT PHASE)

This phase combines AI speed with human judgment.

Step 1 — Line Item Extraction

DeepSeek extracts every GAEB and Excel line item including quantities, dimensions, specifications, brands, standards, and units.

Step 2 — Supplier Price Matching

DeepSeek compares extracted line items against:

- historical supplier quotations
- ERP pricing database
- old tenders
- Excel pricing sheets
- supplier catalogs
- archived emails

AI Output:

- closest supplier match
- last known price
- confidence score
- margin estimate
- historical supplier references

Red / Yellow / Green Logic

DeepSeek flags:

- abnormal pricing
- inconsistent units
- risky margins
- unknown suppliers
- suspicious quantities

Claude Responsibilities:

- review risky pricing decisions
- review unclear specifications
- review compliance-sensitive positions
- detect contradictions
- validate complex calculations

Human Responsibilities:

Humans still decide:

- final price
- margin strategy
- supplier selection
- negotiation strategy
- risk acceptance

PHASE 6 — CUSTOMER APPROVAL

This remains a mandatory human gate.

DeepSeek Responsibilities:

- generate pricing packs
- generate summaries
- generate approval drafts
- send reminder cadence (T-5, T-3, T-1)
- track customer silence

Claude Responsibilities:

- review strategic communication
- escalation analysis
- customer risk evaluation

Hard Rule:

NO written approval = NO submission.

PHASE 7 — DOCS + QC + SUBMIT

Goal: eliminate operational chaos before submission.

DeepSeek Responsibilities:

- collect TYPE 2 documents
- assemble submission packages
- validate completeness
- detect missing forms
- generate checklists
- archive submission receipts automatically

Claude Responsibilities:

- final compliance review
- exclusion criteria validation
- contradiction detection
- high-risk tender review
- final QA sign-off recommendation

Human Responsibilities:

Portal submission remains human-controlled.

PHASE 8 — RESULT & FOLLOW-UP

Future automation zone.

DeepSeek Responsibilities:

- KPI aggregation
- win/loss statistics
- supplier scoring
- historical analytics
- profitability analysis

Claude Responsibilities:

- strategic trend analysis
- operational recommendations
- loss pattern analysis
- process optimization recommendations

FINAL MODEL SPLIT

DeepSeek should handle:

scraping, OCR, parsing, Excel, GAEB, extraction, supplier matching, repetitive workflows, reminders, automation support, CRM enrichment, and operational bulk processing.

Target: 70–90% of total AI volume.

Claude should handle:

supervision, orchestration, QA, compliance, strategic reasoning, risk evaluation, escalations, and final reviews.

Target: 10–30% of total workload.

ESTIMATED COST STRUCTURE

Architecture	Estimated Monthly Cost
Full Claude	~2500€
Hybrid (Recommended)	~300–700€
Mostly DeepSeek	~50–200€
